dipteral

δίπτερος

Two rings of columns all round. Vitruvius names the Ionic temple of Diana at Ephesus by Chersiphron. III.2 does not give a flank count. The initial 15 extends his separate peripteral rule; changing that choice changes the inner count.

2 D clear between columns; 46 columns on the outer ring; 38 on the inner ring. D is one lower column diameter.

Front at bottom. Black columns show the type's arrangement within the selected model. Grey geometry includes drawing choices. Read their basis below.

What fixes this dipteral drawing?

Basis	Feature	Reading of this plan
Text	**Front and back**	8 columns across each end; a double ring around the temple. Corner columns are included in the side counts. Vitruvius III.2.7–8

Basis	Feature	Reading of this plan
Drawing choice	**Long sides**	17 columns on each long side. III.2 does not state this count for the dipteral. The initial 15 extends the double-intercolumniation rule of III.4.3, whose wording specifically says “in peripteral temples”. Other counts here test that assumption. Vitruvius III.2.7–8; Vitruvius III.4.3
Calculation	**Count each corner once**	Outer ring: 2 × 8 + 2 × 17 − 4 = 46 columns. The chosen inner rectangle is 6 × 15: 38 columns.
Calculation	**The 34-column reading**	This inner ring has 38 columns. Krohn prints 34 for the rows Hermogenes removed, adopting Philander’s correction of the transmitted 38. An 8 × 15 outer rectangle gives 34 inside; an 8 × 17 gives 38. Geometry alone cannot decide the wording: the assumed plan has changed too. Vitruvius III.3.8
Drawing choice	**Walls and rooms**	Wall thickness 1 D; doorway width one quarter of the body width. Porch partitions, end setbacks and internal columns are illustrative. Both exterior rings share an axis grid; the inner ring is inset by one axis interval. Vitruvius III.2.7–8
Drawing choice	**Spacing and scale**	D is the lower column diameter. Clear gap 2 D; axis interval 3 D. III.3 describes 1½, 2 and 3 D spacings separately from the plan types. Choosing one here does not establish that an ancient temple used it. Platform margins, door widths and all wall thicknesses away from the antae are drawing choices. Vitruvius III.3.1–4

Read the passages

Vitruvius III.2.7–8

dipteros avtem octastylos et pronao et postico, sed circa aedem dvplices habet ordines colvmnarvm … hypaethros vero decastylos est in pronao et postico, reliqva omnia eadem habet qvae dipteros, sed interiore parte colvmnas in altitvdine dvplices, remotas a parietibvs ad circvmitionem vt porticvs peristyliorvm, medivm avtem svb divo est sine tecto. aditvs valvarvm ex vtraqve parte in pronao et postico.

The dipteral has eight columns on front and back, but a double row of columns around the temple … The hypaethral has ten columns on front and back and everything else as the dipteral, but inside, two-storey columns set away from the walls so one can walk round, like the porticoes of a peristyle; the middle is under the sky, without a roof. Doorways give access at both ends, in the front porch and at the rear.

Krohn 1912, pp. 63–64.

Vitruvius III.3.8

Eas avtem symmetrias constitvit Hermogenes, qvi etiam primvs invenit octastylon psevdodipterive rationem. ex dipteri enim aedis symmetria distvlit interiores ordines colvmnarvm xxxiv eaqve ratione svmptvs operasqve

compendii fecit.

Hermogenes established these proportions, and he first devised the octastyle pseudodipteral plan: from the layout of the dipteral temple he took away the inner rows of 34 columns, and so saved expense and labour.

Manuscripts: xxxviii (38). Printed: xxxiv (34), Philander, a sixteenth-century editor. A dipteral plan of eight by fifteen has an inner ring of six by thirteen: 34 columns. The initial 8 by 15 model gives the printed number; changing its flank count changes the result. Whether Vitruvius wrote 34 is another matter.

Krohn 1912, p. 66.

Vitruvius III.4.3

ita colvmnae in peripteris conlocentvr, vti, qvot intercolvmnia svnt in fronte, totidem bis intercolvmnia fiant in lateribvs; ita enim erit dvplex longitvdo operis ad latitvdinem. namqve qvi colvmnarvm dvplicationes fecervnt, erravisse videntvr, qvod vnvm intercolvmnivm in longitvdine plvs qvam oporteat procvrrere videtvr.

In peripteral temples set the columns so that the flanks have twice as many intercolumniations as the front; then the length of the work will be double its width. Those who doubled the columns seem to have erred, because the length then appears to run on by one intercolumniation more than it should.

Krohn 1912, p. 69.

Vitruvius III.3.1–4

pycnostylos est, cvivs intercolvmnio vnivs et dimidiatae colvmnae crassitvdo interponi potest … systylos est, in qva dvarvm colvmnarvm crassitvdo in intercolvmnio poterit conlocari … diastyli avtem haec erit compositio, cvm trivm colvmnarvm crassitvdinem intercolvmnio interponere possvmvs

Pycnostyle is the arrangement in which the thickness of one and a half columns can be set in the intercolumniation; systyle, in which two columns' thickness can be set; diastyle, when we can set the thickness of three columns in the intercolumniation.

valvarum ex utraque parte in pronao et postico. huius item exemplar Romae non est, sed Athenis octastylos ex templo Olympio.

III Species autem aedium sunt quinque, quarum ea sunt vocabula: pycnostylos, id est crebris columnis, systylos paulo remissioribus, diastylos amplius quam oportet inter se ductis, araeostylos spatiis intercolumniorum patentibus rare,
2 eustylos intervallorum iusta distributione. ergo pycnostylos est, cuius intercolumnio unius et dimidiatae columnae crassitudo interponi potest, quemadmodum est divi Iulii et in Caesaris foro Veneris et si quae aliae sic sunt compositae. item systylos est, in qua duarum columnarum crassitudo in intercolumnio poterit conlocari, et spirarum plinthides aeque magnae sint ei spatio, quod fuerit inter duas plinthides, quemadmodum est Fortunae Equestris ad theatrum lapideum reliquaeque, quae eisdem rationibus sunt compo-
3 sitae. haec utraque genera vitiosum habent usum. matres enim familiarum cum ad supplicationem gradibus ascendunt, non possunt per intercolumnia amplexae adire, nisi ordines fecerint; item valvarum aspectus abstruditur columnarum crebritate ipsaque signa obscurantur; item circa aedem propter
4 angustias inpediuntur ambulationes. diastyli autem haec erit compositio, cum trium columnarum crassitudinem intercolumnio interponere possumus, tamquam est Apollinis et Dianae aedis. haec dispositio hanc habet difficultatem, quod epistylia propter intervallorum magnitudinem franguntur.
5 in araeostylis autem nec lapideis nec marmoreis epistyliis uti datur, sed inponendae de materia trabes perpetuae. et

Eas autem symmetrias constituit Hermogenes, qui etiam primus invenit octastylon pseudodipterive rationem. ex dipteri enim aedis symmetria distulit interiores ordines columnarum XXXIV eaque ratione sumptus operasque compendii fecit. is in medio ambulationi laxamentum egregie circa cellam fecit de aspectuque nihil inminuit, sed sine desiderio supervacuorum conservavit auctoritatem totius
9 operis distributione. pteromatos enim ratio et columnarum circum aedem dispositio ideo est inventa, ut aspectus propter asperitatem intercolumniorum habeat auctoritatem, praeterea, si ex ⟨improviso⟩ imbrium aquae vis occupaverit et intercluserit hominum multitudinem, ut habeat in aede circaque cellam cum laxamento liberam moram. haec autem ut explicantur in pseudodipteris aedium dispositionibus! quare videtur acuta magnaque sollertia effectus operum Hermogenes fecisse reliquisseque fontes, unde posteri possent haurire disciplinarum rationes.

10 Aedibus araeostylis columnae sic sunt faciendae, uti crassitudines earum sint partis octavae ad altitudines. item in diastylo dimetienda est altitudo columnae in partes octo et dimidiam, et unius partis columnae crassitudo conlocetur. in systylo altitudo dividatur in novem et dimidiam partem, et ex eis una ad crassitudinem columnae detur. item in pycnostylo dividenda est altitudo in ⟨partes⟩ decem, et eius una pars facienda est columnae crassitudo. eustyli autem aedis columnae, uti systyli, in novem partes altitudo dividatur et dimidiam partem, et eius una pars constituatur in crassitudine imi scapi. ita habebitur pro rata parte intercolum-
11 niorum ratio. quemadmodum enim crescunt spatia inter

pycnostyla, sive systylo aut diastylo aut eustylo, quemadmodum supra scripta sunt et constituta. in araeostylis enim libertas est quantum cuique libet constituendi. sed ita co-
(10) lumnae in peripteris conlocentur, uti, quot intercolumnia
5 sunt in fronte, totidem bis intercolumnia fiant in lateribus; ita enim erit duplex longitudo operis ad latitudinem. namque qui columnarum duplicationes fecerunt, erravisse videntur, quod unum intercolumnium in longitudine plus quam
(15) oporteat procurrere videtur. gradus in fronte constituendi 4
10 ita sunt, uti sint semper inpares; namque cum dextro pede primus gradus ascendatur, item in summo templo primus erit ponendus. crassitudines autem eorum graduum ita finiendas censeo, ut neque crassiores dextante nec tenuiores
(20) dodrante sint conlocatae; sic enim durus non erit ascensus.
15 retractiones autem graduum nec minus quam sesquipedales nec plus quam bipedales faciendae videntur. item si circa aedem gradus futuri sunt, ad eundem modum fieri debent. sin autem circa aedem ex tribus lateribus podium faciendum
(25) erit, id constituatur, uti quadrae, spirae, trunci, coronae,
20 lysis ad ipsum stylobatam, qui erit sub columnarum spiris,
77 conveniant. stylobatam ita oportet exaequari, uti habeat per medium adiectionem per scamillos inpares; si enim ad libellam dirigetur, alveolatum oculo videbitur. hoc autem, ut scamilli ad id convenientes fiant, item in extremo libro
) 25 forma et demonstratio erit descripta.

His perfectis in suis locis spirae conlocentur, eaeque ad V symmetriam sic perficiantur, uti crassitudo cum plintho sit columnae ex dimidia crassitudine proiecturamque, quam Graeci εκφοραν vocitant, habeant s extantem; ita tum lata
) 30 et longa erit columnae crassitudinis unius et dimidiae. alti- 2
